

Client Handoff & Process Guide

LeadFinder — Lead intelligence & decision-maker discovery

Application	https://intelligent-lead-finder.vercel.app
Prepared for	Client onboarding
Hosting	Vercel (web) · Supabase (database & auth) · background worker
Scope	Search → Enrich → Review → Export / Google Sheets sync

How to think about LeadFinder

This platform is for research, organization, review, and export of business data. It does **not** send cold email, SMS, or any automated outreach.

1 · What LeadFinder does

LeadFinder turns a simple search — an industry and a location — into a clean, deduplicated database of businesses and their decision-makers, ready to export or push straight into your own Google Sheet. It runs the whole pipeline for you: collect from Google Maps, normalize and de-duplicate, optionally find decision-makers with verified emails and phone numbers, then review and deliver.

- **Search** — enter an industry/term, country, city, and result count.
- **Estimate & confirm** — see the low/expected/high cost before anything runs, and approve a hard spending cap.
- **Collect & dedupe** — companies are normalized and de-duplicated automatically (never the same business twice).
- **Decision-makers** — optionally add names, titles, work emails, phones, and LinkedIn profiles.
- **Deliver** — export CSV/XLSX or auto-sync every new lead into a Google Sheet.

2 · Your access

URL	https://intelligent-lead-finder.vercel.app
Sign in	Email & password. Creating an account signs you straight in — no verification email to wait for.
Workspace	Your team's private space. All data is isolated per workspace.
Roles	Owner, Admin, Researcher, Operations, Viewer — each with the right permissions.
Install as app	Use the Install app button in the sidebar (Chrome/Edge) for a desktop/phone app icon.

3 · The everyday workflow

1	Open Lead Finder	Enter your industry/term, country, and city. Set how many companies to collect.
2	Optional: decision-makers	Turn on decision-maker discovery to also collect names, titles, work emails and phones.
3	Review the cost	The right-hand panel shows low / expected / high cost live, plus your remaining budget.
4	Confirm the hard cap	Approve a maximum spend. The run can never exceed it — it's sent to the provider as a hard limit.
5	Watch it run	The run page updates through each stage: collecting, ingesting, normalizing, de-duplicating.
6	Review & organize	Browse Companies and Decision Makers, add records to a List, tag and filter.
7	Deliver	Export CSV/XLSX, or let auto-sync push new leads into your Google Sheet.

4 · Connecting your data provider (Apify)

LeadFinder uses a "bring-your-own-key" model: your workspace connects its own Apify account, so provider costs are billed to you at cost with no markup. You enter the key once, in **Settings** → **Integrations**. It is encrypted and never shown again.

- In Apify Console → **Settings** → **API & Integrations**, copy your API token.
- In LeadFinder → **Integrations** → **Apify**, paste it, choose your plan tier, and click **Test & connect**.
- A green **Connected** badge means you're ready. The token is stored encrypted; only a short fingerprint is ever displayed.

No key yet? Use test mode

Prefer to try it first with zero cost? Every workspace has a built-in **Fixture (test data)** provider that runs the entire flow on clearly-labeled sample data for free.

5 · Cost controls you can trust

- **Per-run hard cap** — you approve a maximum \$ amount for every search; the provider enforces it.
- **Monthly budget** — new paid runs are blocked once the workspace budget is reached; a warning shows at 80%.
- **Estimate vs. actual** — every run reconciles what it really cost against the estimate, on the Usage & Costs page.
- **Raising limits** requires re-entering your password and is written to the audit log.

6 · Google Sheets — your live lead database

Connect a Google Sheet once and every completed search automatically appends its new leads — de-duplicated, so a business never lands in your sheet twice. Setup is a one-time, no-code step:

- In LeadFinder → **Integrations** → **Add a destination**, choose **Google Sheets**.
- Open a Google Sheet → **Extensions** → **Apps Script**, paste the script shown (your secret is pre-filled), and Save.
- **Deploy** → **New deployment** → **Web app** (Execute as: Me · Access: Anyone), and copy the Web app URL.
- Paste that URL back into LeadFinder, keep **Auto-sync** on, and Save. Click **Test** to drop a sample row.

The result

From then on, finishing a search quietly fills your sheet with fresh, unique leads — company name, category, website, emails, phones, LinkedIn, and (optionally) decision-makers. It becomes the client's living database without anyone exporting a file.

7 · Exports

Prefer files? **Exports** builds CSV or XLSX from any list or your whole database. Files are generated in the background, protected against spreadsheet formula-injection, and downloaded via a link that expires after 24 hours. A personal-data acknowledgement is required when the export includes contact details.

8 · Data you can rely on

- Company email, decision-maker work email, company phone, and direct phone are kept as **separate** fields — never mixed.
- Company LinkedIn and personal LinkedIn are stored separately.
- Email states are exactly what the provider reported: verified, catch-all, unverified, invalid, or unavailable.
- Missing data stays blank — LeadFinder never invents a name, email, or phone number.

9 · Trial & plan

New workspaces start on a **14-day trial**. During and after the trial your data and test runs stay fully available; once it ends, paid runs pause until the workspace is activated. You'll see a banner counting down the last few days.

10 · Support & good to know

- **Additional providers** (Outscraper, Prospeo, Apollo) are on the roadmap; Apollo stays disabled until commercial-use terms are in place.
- **Daily volume:** to keep costs down, run different cities/areas on different days rather than repeating the same search — de-duplication already prevents duplicate records.
- **Questions or issues:** reach your LeadFinder contact; every sensitive action is captured in the in-app Audit Log.
