

Why LeadFinder

... instead of just logging into Apify yourself

The question every client asks

"Apify already scrapes Google Maps — why would I pay for LeadFinder instead of using Apify directly?" It's the right question. Here is the honest answer.

Apify is an engine. LeadFinder is the car.

Apify is a powerful, developer-oriented platform for running scrapers. It gives you a raw actor, a JSON input form with dozens of fields, an API token to manage, pay-per-event billing with no guardrails, and a dataset of raw, duplicated results. That's perfect for engineers. It is not a product your sales team, VA, or client can safely operate — and it stops at raw data.

LeadFinder wraps that same engine in a finished product: a guided workflow, hard cost controls, automatic de-duplication, decision-maker intelligence, team roles, and delivery straight into the client's Google Sheet — with no token juggling and no surprise bills.

Side by side

	Using Apify directly	LeadFinder
Who can run it	Developers comfortable with JSON & API tokens	Anyone — sales, VAs, clients. Guided form.
Cost safety	Pay-per-event; easy to overspend	Hard per-run cap + monthly budget, enforced
Duplicates	Raw dataset repeats businesses across runs	Automatic de-duplication by place, domain & phone
Decision-makers	Separate config; raw fields	Names, titles, verified emails, phones — labeled & separated
Data quality	Raw JSON, mixed fields	Normalized; company vs personal kept distinct; honest null states
Delivery	Download JSON/CSV yourself	CSV/XLSX + auto-sync into the client's Google Sheet
Teams	One account, one login	Workspaces, roles, invitations, audit log
Multi-client	Share one risky token	Isolated workspaces; each brings its own key

	Using Apify directly	LeadFinder
Billing model	You reconcile Apify invoices	Trials, plans, per-workspace usage & cost ledger
Compliance	Your responsibility	Audit trail, retention controls, no-outreach by design

The five things clients actually pay for

1. They never touch a token or a JSON form

The whole reason a client hires you is to *not* become an Apify operator. LeadFinder is a clean form: industry, city, count. No API keys, no actor input schema, no failed runs from a wrong field.

2. Costs can't run away

Every paid run shows a low/expected/high estimate and requires an approved hard cap that the provider enforces. A monthly budget blocks overspend. Clients see exactly what a search cost, estimate vs. actual, every time.

3. The data is clean, not raw

Apify returns raw, duplicated rows. LeadFinder de-duplicates automatically (a business never appears twice, even across days), separates company vs. personal contact fields, and keeps verification states honest — so the sheet you hand over is usable immediately.

4. Leads flow into their Google Sheet automatically

This is the feature that sells. Connect a sheet once; every completed search appends new, unique leads — the client watches their database fill itself. No exports, no copy-paste, no duplicates.

5. It's multi-client and team-ready

Isolated workspaces, roles, invitations, trials, and a full audit trail mean you can run this as a service across many clients — each with their own key and budget — instead of sharing one dangerous Apify login.

Positioning in one line

Apify sells raw scraping power to engineers. LeadFinder sells finished, deduplicated, decision-maker-ready leads that appear in your Google Sheet on autopilot — safe enough to put in a client's hands.

Who it's for

- **Agencies** reselling lead-gen to many clients — isolated workspaces, per-client keys, trials & plans.
- **Sales teams** that want a repeatable, budget-safe way to build territory lists.
- **Non-technical operators & VAs** who should never see an API token.

Live now at <https://intelligent-lead-finder.vercel.app> — start on a 14-day trial with built-in test mode, connect an Apify key when ready, and wire a Google Sheet in minutes.
