

LeadFinder

One lead engine for Google Maps + Yelp — reviewed, deduplicated, delivered

WHY NOT JUST APIFY?

“Couldn’t I just run the scrapers on Apify myself?”

You could — the same way you could buy an engine instead of a car. Apify sells excellent raw scrapers, and LeadFinder proudly runs on them (bring your own key; you pay Apify their prices, we add no markup on data). What Apify gives you is a JSON file per run. What your team actually needs is a clean, growing lead database with costs under control — that is the product.

What raw Apify leaves you to do by hand

- **Every run is an island.** Ten runs = ten disconnected JSON datasets with the same businesses repeated. You get to merge them in spreadsheets, forever.
- **No memory.** Apify doesn’t know you already have a lead. LeadFinder deduplicates every new run against your whole database — by place ID, Yelp ID, domain, phone, and name+address — so your list stays clean as it grows.
- **No cost guardrails by default.** On raw Apify, one wrong input can burn a budget. Every LeadFinder run shows a low/expected/high estimate first and sends an enforced hard spending cap with the job.
- **No workflow.** Statuses, lists, tags, owners, review queues, team roles, audit trails — none of that exists in a dataset file.
- **No delivery.** LeadFinder auto-appends each new lead to your Google Sheet or webhook, labeled by source, never duplicated. Apify gives you an export button.

One platform, both lead sources

	Raw Apify console	LeadFinder
Sources	One Actor at a time, separate outputs	Google Maps (Apify or Outscraper) + a dedicated Yelp tab, one shared database
Results	JSON dataset per run	Deduplicated companies with source badges (Google Maps / Yelp / both)
Cost	Console usage page, after the fact	Estimate before, hard cap during, exact reconciled cost after — per run
Contacts	—	Optional Prospeo enrichment: verified work emails; repeat lookups free for 90 days
Delivery	Manual export	Auto-sync to Google Sheets / webhook with a Source column
Team	One account, full access	Roles & permissions, per-workspace isolation, full audit log
Safety	Your inputs, your risk	Server-built inputs, provider minimums enforced, budgets & per-run caps

Honest economics — where the savings really come from

Straight answer: scraping is billed per scraped result by the provider, whoever presses the button — deduplication cannot refund a scrape. The real savings are structural:

- **A permanent clean database** instead of re-merging spreadsheets — the hours are the biggest cost in lead gen.
- **Never pay twice for enrichment you own.** Verified emails live in your database; enrichment memory (and Prospeo's 90-day free repeats) means a contact is bought once.
- **No wasted runs.** Estimates, caps, and category filters stop the classic raw-scraper mistakes: runaway runs, duplicate areas, off-target categories.
- **Cheapest source per job.** Pick Apify's rich Google Maps data, Outscraper's \$3/1k volume rate, or Yelp's \$2.75/1k — per search, from one screen.

Real example from this workspace: a 30-business Yelp search cost exactly **\$0.0915** ($30 \times \$2.75/1k + \text{one } \$0.009 \text{ Actor start}$) — estimated before the run, capped during it, and reconciled to the tenth of a cent after. That level of cost visibility simply doesn't exist in a raw console workflow.

The pitch in one sentence

Apify is a brilliant engine; LeadFinder is the car — sources, dedupe, budgets, review, team, and delivery to your sheet, built around honest per-run economics.
